## **16 mm Wire Reinforced Climbing Nets Installation Recommendations**

Nets are made with 16 mm wire reinforced rope, stainless steel clips or plastic two part connectors, galvanised eyebolts aluminium ferrules, plastic tees and galvanised chain.

The eyebolts will be found on the top of the net, the chain will be found at the bottom of the net, the clips or connectors are the parts that connect the two ropes together where they cross over.

The nets have been manufactured in accordance with BSEN1176/77 and should be installed as per these guidelines.

When the climbing net is installed the horizontal ropes must be on top of the vertical ropes, the eyebolts must be fitted so the shoulder of the eyebolt is flush/tight to the platform or rail, the net must be fitted as taut as possible any slack or movement in the net will increase the wear.
