Polypropylene “V” Bridge Installation Recommendations

The bridge can be fitted using this method, it has been manufactured in accordance with BSEN1176/77 and should be installed as per these guidelines.

The bridge is made from 16mm polypropylene rope with 2 x 24mm centre ropes which have 1,000mm tails at each end, these need to be fixed to the platform, by either drilling a hole and tying a knot at the back or by passing the rope around the timber and fixing into place using a poly halve clip.

The side ropes have 800mm tails on all the ends, these can be fitted to the tower in the same way.

Poly halve clips and screws can be purchased using code SWP_PH via our online shop

The bridge must be fitted as taught as possible, any slack or movement in the bridge will increase the wear.

Recommended user weight is approx. 100 kilos at any one time.

Supervision is always needed when the net is being used by children.
